

Globalization and Mobility

GROUP 4

Global City Concepts & Urbanization

KEY CONCEPTS

Global City

Cities in Globalization

Urbanization

Urban Development

City Growth

Urban Challenges

GLOBAL CITY

A **global city** is a major urban center that serves as a **primary node** in the global economic, political, and cultural network.

GLOBAL CITY

Characteristics of a Global City:

- **Economic center**
- **International connections**
- **Cultural diversity**
- **Political importance**
- **Large labor market**
- **Technology and communication**
- **Transportation hub**

URBANIZATION

Urbanization is the process in which more **people move from rural areas to cities**, causing urban areas to grow in population, size, and economic activity.

URBANIZATION

Why does urbanization happen?

- **Education**
- **Healthcare**
- **Better infrastructure**
- **Higher income opportunities**
- **Industrialization**

CITY GROWTH

City growth refers to the **increase** in the population, physical size, infrastructure, and economic activities of a city.

CITY GROWTH

As a city grows, it may develop:

- **More buildings and housing**
- **More roads and transportation**
- **Shopping centers and businesses**
- **Schools and hospitals**
- **Industrial areas**
- **New residential communities**

CITIES IN GLOBALIZATION

Globalization is the increasing connection and interaction between countries through trade, technology, communication, migration, culture, and investment.

CITIES IN GLOBALIZATION

Cities are important to globalization because they act as **connections or gateways between countries and economies.**

Urban Development

Urban development is the process of planning, building, and improving cities to support their growing populations and economic activities.

Urban Development

The main goal is to create cities that are:

- **Livable** – comfortable and safe for residents
- **Efficient** – resources and services are properly managed
- **Inclusive** – different groups can access opportunities and services
- **Sustainable** – development does not unnecessarily damage the environment
- **Resilient** – cities can prepare for and recover from disasters

Urban Challenges

These are **problems that are created or intensified by rapid urban growth**, such as traffic, pollution, housing shortages, and inequality

Urban Challenges

As cities grow, they can experience several problems:

- **Overpopulation and Overcrowding**
- **Housing Shortages**
- **Traffic Congestion**
- **Pollution**
- **Waste Management**
- **Inequality**
- **Environmental Problems**
- **Disaster Risks**
- **High Cost of Living**

GLOBAL CITY IN PRACTICE: DAVAO CITY

Urban Population Growth

- Davao City has experienced continuous urban growth.
- More people move toward urban areas for jobs, education, and better opportunities.
- Population growth increases the demand for:
 - Housing
 - Transportation
 - Schools
 - Healthcare
 - Employment

Rural-to-Urban Movement

- People from rural areas move to Davao City for:
- Employment opportunities
- Education
- Better access to services
- Business opportunities
- Migration contributes to the expansion of urban communities.
- This can also increase pressure on housing and infrastructure.

Housing & Informal Settlements

- Rapid urban growth can create a shortage of affordable housing.
- Some low-income families may settle in informal settlements.
- Informal communities may face challenges such as:
 - Limited access to basic services
 - Poor infrastructure
 - Flooding and other environmental risks
 - Unstable housing conditions

Relocation & Access to Urban Services

- Relocation programs may move families from areas considered unsafe or unsuitable for housing.
- Relocated residents need access to:
- Water and electricity
- Schools
- Healthcare
- Transportation
- Employment
- A major challenge is ensuring that relocated communities remain connected to economic opportunities.

Davao City: A Local Example

1. Urban Growth

- Increasing population and development

2. Migration

- Movement of people toward the city

3. Housing

- Demand for affordable and secure housing

4. Urban Services

- Need for transportation, education, healthcare, utilities, and employment

Population Patterns & Demographic Trends

by: Edillo

Key Topics:

Meaning of Demography

Population Growth

Population Distribution

Differences Across Regions

Major Demographic Trends

Meaning of Demography

Demography is the study of populations.

It looks at:

- **Population size**
- **Age and sex**
- **Births and deaths**
- **Migration**
- **Population changes over time**

Population Growth

Population growth means the increase or decrease in the number of people.

It is affected by:

- Birth rate
- Death rate
- Migration

Example:

More births than deaths → population increases.

Population Distribution

Population distribution refers to where people live.

- Some places have many people.
- Other places have fewer people.
- People often live near cities, jobs, water, and resources.

Differences in Population Across Regions

Population differs from one region to another because of:

- Geography and climate
- Available resources
- Economic opportunities
- Jobs and education
- Government and living conditions

Major Demographic Trends

Major trends include:

- **Population Growth** – populations continue to change
- **Population Aging** – more people are reaching older ages
- **Urbanization** – more people are moving to cities
- **Migration** – people move between places
- **Changing Population Structure** – age and population composition change

Conclusion

Population patterns help us understand:

- Where people live
- How populations change
- Why populations differ
- How demographic trends affect society

Key Idea:

Understanding population helps us understand how societies change.

Demography, Urbanization, and Population Mobility

Demography

The study of population size, structure, and changes.

Urbanization

**The growth of cities as more people
line in urban areas**

Population Mobility

The movement of people from one place to another

These concepts are connected

population change

urbanization

mobility

changes in Cities

How population changes affects Cities

- **Greater demand for housing**
- **Increased demand for transportaion**
- **The need for more schools and public services**
- **Greater demand for jobs**
- **Traffic congestion**

Population Concentration

- it refers to the number of people living in a particular area.

People tend to concentrate in places with:

- More employment opportunities
- Better education and health care
- Business and economic activities
- Access to essential services

Davao City

- highly urbanized city and the largest urban population center in Davao Region
- provides greater employment, education, businesses, transportation, and public services

Global Migration

Key Topics:

What is Migration

Immigration vs Emigration

Migration Patterns

Causes and Effects

**If you were given the
opportunity to move to
another country, would you?**

Global Migration

- The movement of people across international borders to live and settle in a foreign country, either temporarily or permanently.
- Reasons include better opportunities, quality of life, safety, or to flee from war, conflict, and poverty.

Global Migration

- Connects labor markets, communities, and economies across countries
- Tourism **is not** migration.

Types of Migration

Duration

- Permanent
- Temporary

Direction

- Immigration
- Emigration

Reason

- Voluntary
- Forced
- Labor
- Educational
- Family

Immigration & Emigration

Immigration

- People **moving into** the country.
- Larger workforce
- Economic Activity
- Population Growth
- Cultural Diversity

Emigration

- People **moving out** of the country.
- Loss of workers
- Remittances
- Brain Drain
- Skill transfers

Reasons to Migrate

Push Factors

- Persecution
- Violence
- War
- Poor Wages
- Lack of Jobs
- Famine
- Pollution
- Natural Disaster
- Family

Pull Factors

- Safety and Stability
- Higher Wages
- Job Prospects
- Better Environment
- Food availability
- Better services
- Better education
- Family Unification

Migration Patterns

- Recurring pattern of movement of people across countries or regions.
- Shaped by persistent environmental, political, economical , social, demographic conditions in both origin and destination countries.

Migration Patterns

Migration Patterns

South to North

- Ex: People moves from lower-income countries towards higher income countries.

South to South

- Migration occurs between developing countries

North to North

- Migration between high-income countries

North to South

- People from higher-income countries move to developing countries.

Migration Patterns

WHY PATTERNS FORM?

Geography

- Corridors - Rivers, Valleys, Coastlines
- Barriers - Borders, Mountains, Deserts, Ocean

Social Networks

- Migrants move to specific destinations where people from their home country have already settled.

Historical and Cultural Connections

- Shared language, colonial history, family ties, and long-standing relationships between countries.

ECONOMIC EFFECTS OF GLOBAL MIGRATION

WHY DO PEOPLE MOVE?

The Basic Economic Logic of Migration

Wage & Opportunity Gaps

Workers Migrate

Labor and Skills are Reallocated

Economic Gains

Gains and Costs are distributed

WHY IT CAN RAISE TOTAL OUTPUT

- Workers may move from lower-productivity environments to places where their labor and skills are used more productively.

WHY THE RESULT IS NOT SIMPLE

- Migration changes labor supply, wages, taxes, remittances, skills, and investment—so different groups experience different outcomes.

CORE MESSAGE

- Migration can create large economic gains, but the benefits and costs are not shared equally across people or countries.

Wage differences create powerful migration incentives

Monthly construction-carpenter wages in 1995.

Important caveat: these are observed wage differences. Part of the gap may reflect differences in worker skills—not only differences in how countries reward the same skill.

Monthly Wage (USD)

Who Gains & Who Loses? and Why it Matters

Migration Changes Employment and Wages

The immediate effect is a change in the supply of labor.

SENDING/ORIGIN COUNTRY

- Labor supply falls as workers leave.
- Workers who remain may face less competition for jobs.
- Wages can rise for groups with high emigration rates.
- The effect depends on which workers leave and how the economy adjusts.

RECEIVING / DESTINATION COUNTRY

- Labor supply increases as migrants arrive.
- Employers gain access to additional workers and skills.
- Effects on native workers' wages and employment vary by context.
- Some sources notes evidence of neutral or even positive effects in some cases.

Mexico case (1970–2000): about 13% of the labor force emigrated to the U.S.; one estimate linked emigration to an ~8% rise in average wages in Mexico.

Skilled migration & human capital

Human capital = the education, training, knowledge, and abilities embodied in workers.

POSITIVE SELECTION

Highly educated workers are often more likely to emigrate than less-educated workers.

WHY SKILLS MOVE

- Countries reward skills differently.
- Higher skill prices raise the potential payoff from migration.
- Migrants also sort toward destinations that reward their skills more strongly.

41

developing countries had tertiary-educated emigration rates above 20% in 2000

WHY IT MATTERS

- Origin countries can lose scarce expertise.
- Destination countries gain productive skills.
- Migration can change the stock and distribution of human capital across countries.

The key issue is not only how many people move — but which skills move.

Brain drain vs. brain gain

Skilled migration can reduce human capital at home—or increase the incentive to build it.

BRAIN DRAIN

- Loss of skilled workers and professional expertise
- Possible loss of productivity spillovers and mentoring
- Publicly financed education may benefit another country
- Future tax contributions from emigrants are lost

Risk is especially serious when scarce professionals leave essential sectors.

BRAIN GAIN

- Higher foreign wages can increase the incentive to study and train
- More people may invest in education to improve migration chances
- Not everyone who acquires skills will actually migrate
- Return migrants may bring back experience, capital, and networks

But the evidence is not conclusive.

Bottom line: migration is economically significant because it redistributes labor, income, skills, and opportunity across borders.

Skilled migration & human capital

Human capital = the education, training, knowledge, and abilities embodied in workers.

ORIGIN / SENDING COUNTRY

- + Remittances support households and consumption
- + Remaining workers may earn higher wages
- + Migration networks can support trade and investment
- Loss of skilled workers can weaken key sectors
- Potential loss of tax revenue and public education investment

DESTINATION / RECEIVING COUNTRY

- + Receives additional labor and scarce skills
- + Can fill labor-market gaps and raise productivity
- + Gains human capital trained partly elsewhere
- +/- Effects on native wages/employment vary
- May face fiscal and political concerns around public services

Bottom line: migration is economically significant because it redistributes labor, income, skills, and opportunity across borders.

Philippine example: remittances as an economic shock absorber

1997–1998 Asian financial crisis as a natural experiment

10%

peso depreciation

was associated with

6%

higher remittances

What happened in households receiving stronger remittance gains?

MORE EDUCATION

Higher spending on children's education and higher school attendance

MORE INVESTMENT

Greater entrepreneurial investment and business activity

MORE DURABLE GOODS

Higher spending on items such as televisions and vehicles

LESS CHILD LABOR

Labor supply of 10–17-year-olds fell more, especially for boys

Takeaway: migration can convert foreign earnings into education, consumption, and investment at home.

Migration Impacts

Migration Impacts

- **Migration impacts** refer to the economic and social changes produced by migration in both origin and destination communities.
- **Affects household income**
- **Changes employment patterns**
- **Transfers money and skills**
- **Influences population distribution**
- **Creates social and community changes**

Remittances and Development

- **Remittances** — Money migrants send to people in their home country.
- Increase household financial resources
- Can support education and healthcare
- Can finance housing and small businesses
- May improve household living conditions
- Connect migration with development

Labor Mobility: From Movement to Impact

- Migration allows workers to access employment opportunities across borders.
 - Destination countries may gain additional workers.
 - Origin countries receive remittances.
 - Workers may gain new skills and experience.
 - Long-term migration can affect the availability of skilled workers in the origin country.
- 
- 

Border Restrictions

- **Border restrictions** — Government rules controlling international movement.

Examples:

- Visas
- Work permits
- Immigration requirements
- Entry restrictions
- Documentation requirements

BORDER RESTRICTION

Impact on migration:

- Can limit access to foreign employment.
- Can affect the movement of workers between countries.
- Can influence where migrants are able to work.
- Can make international labor mobility more difficult.

Social and Economic Effects

Social and Economic Effects

Economic effects

- Increased household income
- Remittances
- Employment opportunities
- Skills and knowledge transfer

Social effects

- Family separation
- Changes in community structure
- Population redistribution
- Increased demand for services

Migration → Population Change → Urbanization

- 
- **Population trends** — Changes in population size and distribution.
 - **Urbanization** — Growth of urban areas as people move toward cities.
 - **Rural-to-urban migration** — Movement toward cities for employment and economic opportunities.
 - Rapid urban growth increases demand for housing, jobs, transportation, and services.

MIGRATION

Population Change

Urbanization

Urban challenges

Greater demand for:

- Housing
- Employment
- Transportation
- Healthcare
- Education
- Other public services

In summary:

- Globalization connects cities, populations, labor, and migration.
- Population changes influence urban growth.
- Migration changes where people live and work.
- Remittances connect migration with household development.
- Migration can create both opportunities and social challenges.
- Urban growth creates additional demands for housing, employment, and public services.
- Development therefore requires attention to income, employment, housing, skills, and social services.

**Thank
You**
